

CLINICAL CONSULTATION & DIAGNOSTIC REPORT

Patient Name:	Valued Patient	Age / Gender:	30 / Undefined
Report Date:	2026-06-08 (Consultation Date)	Report Reference:	REF-AI-20260608-001

SYMPTOM ANALYSIS & TABULAR CLASSIFIER INFERENCE

Reported Symptoms:	Cough
Primary Diagnosis prediction:	COVID-19 (Confidence: 100.00%)
Algorithm Model Used:	PyTorch Multi-Layer Perceptron (MLP) / Scikit-Learn Random Forest

EXTERNAL IMAGE CLASSIFICATION & DERMATOLOGY INFERENCE

Uploaded Lesion Visual Scan:	
Dermatological Finding:	Stye (Confidence: 99.50%)
Scope Constraints:	External Surface Anatomical Analysis Only (Rashes, Acne, Lesions)
Algorithm Model Used:	PyTorch Convolutional Neural Network (Transfer Learning via ResNet-18)

RECOMMENDED CLINICAL SCANS & PROCEDURAL TESTS

Based on the AI model inference and clinical alert criteria, the following diagnostic scans and medical tests are recommended for absolute clinical verification:

- Chest CT (if severe lung involvement)
- SARS-CoV-2 RT-PCR Test
- Rapid Antigen Test
- General Routine Blood Work
- Clinical Evaluation

■■ IMPORTANT CLINICAL NOTICE & DISCLAIMER

This report is generated by a clinical demonstration machine learning system trained for academic and Capstone evaluation. It does NOT substitute for professional medical consultation, lab diagnostic testing, or clinical evaluations. If you are experiencing severe symptoms, immediate emergency room consultation or a visit to a registered medical practitioner is required. The diagnostic suggestions represent probabilistic inferences based on training datasets (DermNet, Kaushil268) and should not be used as clinical diagnosis.
